

Festify by Muhammad Irfan Bin Ishak, Muhammad Irfan Bin Mohd Ropi, Ahmad Adi Imran Zuraidi, Afif Bin Mohd Hishamuddin binmohdropi@wisc.edu - @ipanropi, ishak4@wisc.edu - @Arashixz, zuraidi@wisc.edu - @adiimrn, binmohdhisha@wisc.edu - @affarf

CS407 Fall 2025 - Group Project

Introduction

Festify is an all-in-one event management app that helps you discover, create, and attend local events. It solves the problem of fragmented event coordination by bringing everything you need into one seamless experience.

Event planning requires multiple apps and tools - Festify consolidates a lot of feature into one unified platform, eliminating the hassle of juggling multiple tools.

Who can use Festify: Organization, Students, Professional

Design: Key Features

Festify leverages mobile-specific capabilities to enhance event interaction:

Real-Time Chat: Instantly communicate with attendees through Firestore streams.

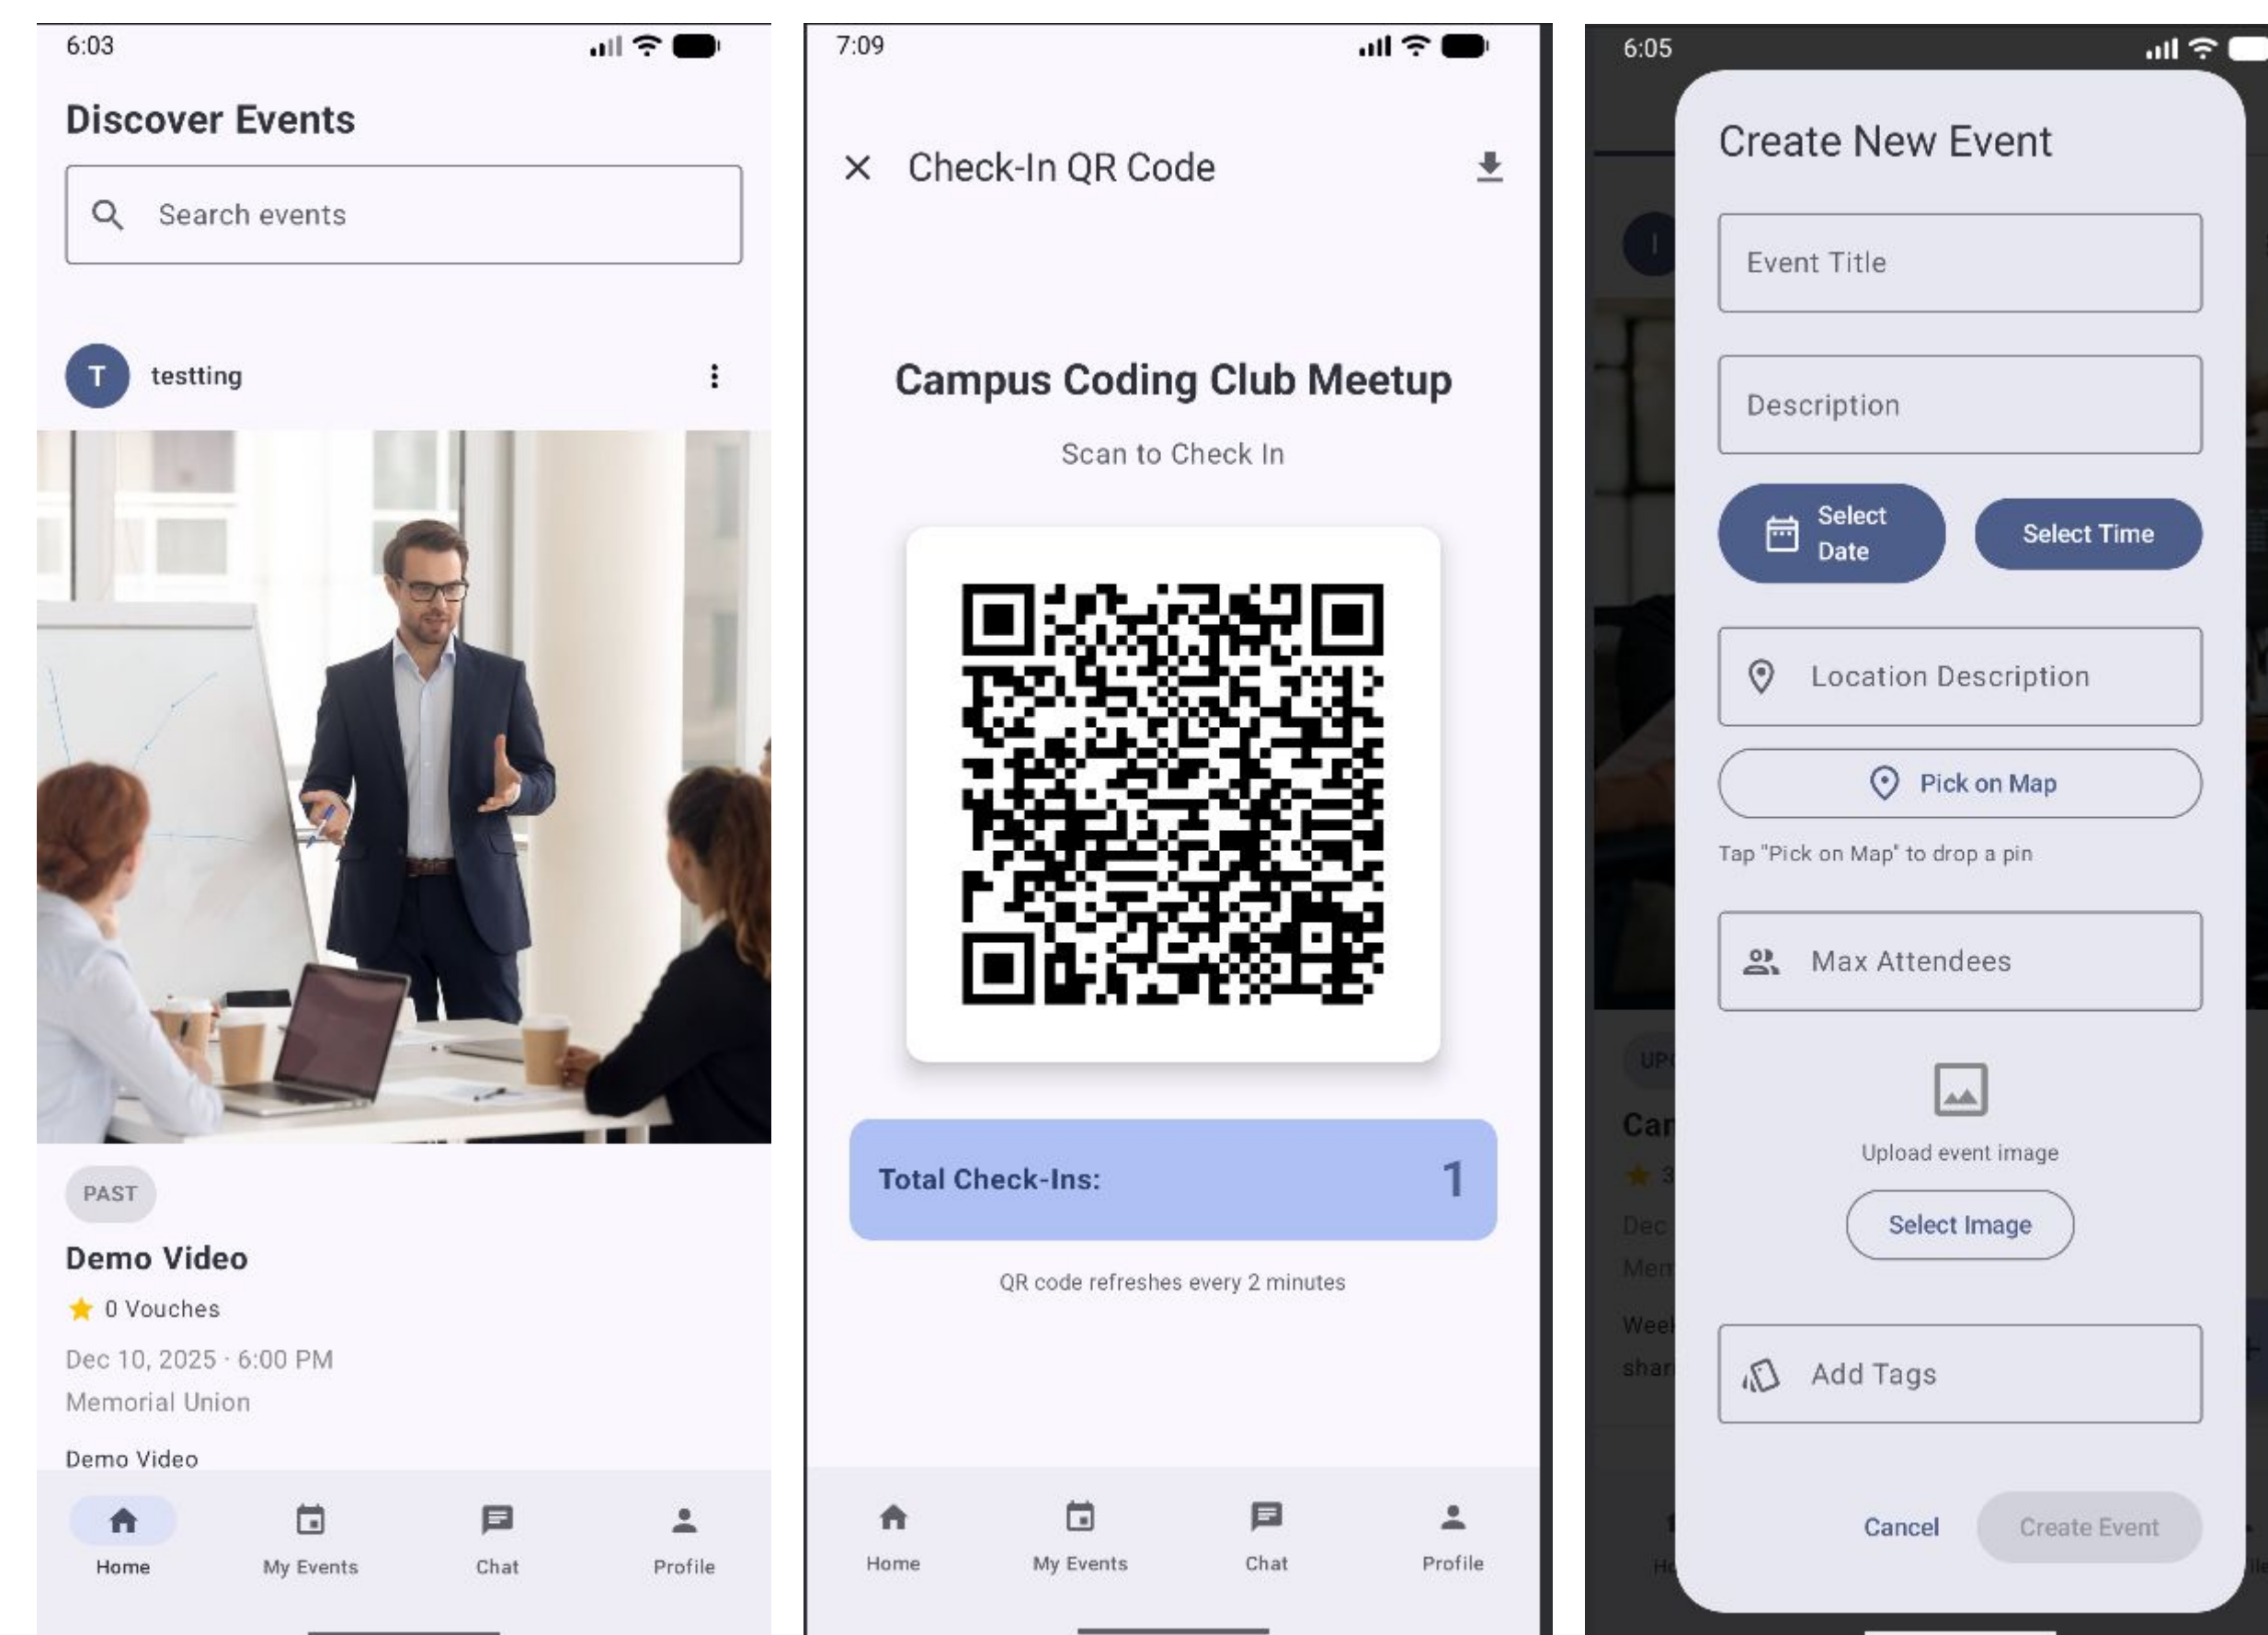

QR Check-In System: Each event generates a unique QR code for fast and secure attendance verification.

Location Detection & Map Integration: Users can drop map pins or browse events happening near them.

Design: User Interface and Technology Stack

Festify's UI is built with Jetpack Compose, offering clean navigation and visually clear event cards on the Home Screen. The Event Creation screen provides simple forms, date/time pickers, image upload, and map-based location selection to make hosting events easy.

A major feature built beyond Labs 1–9 is the QR Check-In system, which uses camera access and ML Kit scanning to verify attendance and update Firestore in real time.

Development Team

Irfan Ropi - Backend Developer

Irfan Ishak - Frontend Developer

Adi Imran - Frontend Developer

Afif - Backend Developer

Challenges and Solutions

Messages in chat weren't updating live - Implemented real-time listeners in Firestore to automatically update the chat

Maps - We planned full Google Maps search but switched to a simpler pin-drop marker due to complexity.

Left out feature: Discover events enhanced UI, sort and filter, events type, notifications, friends only events

User Feedback/ Future Work

Enhanced Profiles: Adding achievement badges and user verification.

Cross-Platform: Expanding to iOS using Kotlin Multiplatform (KMP)
